Q.3

(5 pts) a. Explain Galvanic cell.

(15 pts) b. Construct a cell for $\text{Ag} + \text{Fe}^{3+} = \text{Ag}^+ + \text{Fe}^{2+}$ at 25°C using the nitrate salts and calculate (a) E° from the given Table and (b) $K_i = (m_+)(m_{++})/(m_{3+})$ at finite dilution.

Table 14.1 Selected values of standard emf of half-cells, E° , at 25°C; E° is also called oxidation potential. Selected values from a table by P. Vanysek in Gen. Ref. (25) for one atm, corrected below to one bar by using (14.23). All metals and salts are in solid state except as indicated, the solvent is water.
